Disclaimer: Field Lead Responsibilities and WHS Compliance

`a { text-decoration: none; color: #464feb; } tr th, tr td { border: 1px solid #e6e6e6; } tr th { background-color: #f5f5f5; }`

Field Leads play a critical role in coordinating safe field operations; however, they do **not** assume the legal duties or responsibilities of other workers, subcontractors, or visitors. Each individual remains responsible for fulfilling their own obligations under applicable WHS legislation, Ecology Consulting policies, and site-specific requirements.

Field Leads must facilitate WHS compliance by:

- Conducting toolbox discussions and ensuring all workers, subcontractors, and visitors understand the day's hazards, controls, and emergency procedures.
- Monitoring site conditions and verifying that required WHS documentation is current, accurate, reviewed, and finalised throughout the project.
- Ensuring that reasonably practicable control measures—consistent with the Hierarchy of Controls—are implemented for all identified risks.

While Field Leads provide direction, oversight, and support, **they cannot and must not** perform the duties of others, nor assume responsibility for an individual's failure to follow safe systems of work.

All incidents, near misses, hazards, or accidents occurring on site must be reported by the Field Lead to the **Communication Officer** and the **WHS Officer**

All workers, subcontractors, and volunteers are required to:

- Apply sound risk-management practices in accordance with the Ecology Consulting WHS Handbook and WHS legislation.
- Carry out their duties in a way that ensures the safety of themselves and others.
- Report hazards, risks, exposures, or losses to the Field Lead immediately and take prompt, safe action to reduce further risk where possible.

Failure to follow these requirements may lead to work cessation, reassignment, or further management action in line with Ecology Consulting's WHS procedures.

The worksite is managed by

- ☒ Ecology Consulting
☐ Contractor

When Ecology Consulting is engaged as a subcontractor, all workers, subcontractors, and visitors must comply fully with both **Ecology Consulting's internal Work Health and Safety (WHS) requirements** and the **Principal Contractor's WHS systems**.

Ecology Consulting's WHS documentation must always be completed in full.

Where the Principal Contractor's WHS requirements are more stringent or site-specific, these will take precedence over Ecology Consulting's procedures.

Compliance includes, but is not limited to:

- **Completion of all Ecology Consulting WHS documents**, ensuring they are accurate, current, and submitted as required.
- Completion of the Principal Contractor's WHS Induction before entering or commencing any work on site.
- Reviewing, understanding, and adhering to the Principal Contractor's Safe Work Method Statements (SWMS), risk assessments, and associated WHS documentation.
- Following all site-specific Emergency Response Procedures, including evacuation routes, muster points, communication protocols, and incident reporting requirements as established by the Principal Contractor.
- Complying with all site rules, PPE requirements, exclusion zones, traffic management controls, plant interaction protocols, and directions issued by Principal Contractor representatives.

Failure to comply with WHS requirements (including Ecology Consulting's internal documentation and Principal Contractor requirements) may result in:

- Immediate removal from site
- Work stoppage
- Corrective or disciplinary action
- Reporting to Ecology Consulting management for further review

All personnel must ensure they understand and follow these obligations at all times to maintain site access and uphold Ecology Consulting's legal and contractual responsibilities.

Toolbox talk checklist

	Yes	No	N/A
The field lead has discussed the field plan with all members of the field team			
The field lead has completed a site risk assessment in collaboration with all team members			
All team members have performed a PPE and equipment check			
The field lead has discussed the field emergency response plan and a designated emergency meeting point has been identified			
The Field Lead has been informed of any team members with at-risk medical or health conditions, and those team members have explained what support they may need.			
The field lead has discussed any site specific access locations and including restricted access areas/NO GO zones			
The field lead has allocated a team member to perform the daily check-ins			

Examples of At-Risk Health or Medical Conditions

- **Asthma or respiratory conditions** (e.g., sensitive to smoke, dust, pollen. *Requires Ventolin*).
- **Severe allergies or anaphylaxis** (e.g., bee/wasp stings, certain foods. *Requires EpiPen*).
- **Diabetes** (risk of low blood sugar. *Requires regular breaks/food/insulin management*).
- **Heart conditions or high blood pressure.**
- **Epilepsy or seizure disorders.**
- **Recent injuries** (e.g., sprains, fractures, reduced mobility).
- **Mental health or psychosocial vulnerabilities** (e.g., anxiety, PTSD triggers, high-stress sensitivity).
- **Heat or cold sensitivity** (history of heat stress, dehydration, hypothermia).
- **Medication-dependent conditions** where emergency access to medication is required.

What is a SWMS?

A **Safe Work Method Statement (SWMS)** is a document that outlines how ecological survey and supervision activities will be undertaken safely within a construction environment

☛ Importantly, ecological surveys on construction sites are often classified as **High Risk Construction Work (HRCW)** due to interaction with plant, clearing operations, uneven terrain, and remote conditions, meaning a SWMS is typically **legally required**.

[Click here for a list of approved Safe Work Method Statements](#)

Select the SWMS that are applicable to your activity/task

- ☐ Work that involves a risk of a person falling more than two metres (note: in some jurisdictions this is 3 metres)
- ☐ Work on a telecommunication tower
- ☐ Demolition of an element of a structure that is load-bearing or otherwise related to the physical integrity of the structure
- ☐ Work that involves, or is likely to involve, the disturbance of asbestos
- ☐ Structural alterations or repairs that require temporary support to prevent collapse
- ☐ Work in or near a confined space
- ☐ Work in or near a shaft or trench with an excavated depth greater than 1.5 metres
- ☐ Work in or near a tunnel
- ☐ Use of explosives
- ☐ Work on or near pressurised gas distribution mains or piping
- ☐ Work on or near chemical, fuel or refrigerant lines
- ☐ Work on or near energised electrical installations or services
- ☐ Work in an area that may have a contaminated or flammable atmosphere
- ☐ Work involving tilt-up or precast concrete
- ☐ Work on, in or adjacent to a road, railway, shipping lane or other traffic corridor that is in use by traffic other than pedestrians
- ☐ Work in areas in which there is movement of powered mobile plant
- ☐ Work in areas in which there are artificial extremes of temperature
- ☐ Work in or near water or other liquid that involves a risk of drowning
- ☐ Work that involves diving work
- ☐ N/A

What is a JSA?

A **Job Safety Analysis (JSA)** is a task-based safety document that breaks down **specific ecological survey activities into individual steps**, identifies hazards at each step, and defines **control measures to manage those risks**.

In ecological fieldwork on construction sites, a JSA is used to:

- Assess **day-to-day survey activities**
- Address **site-specific and changing conditions**
- Support safe work where tasks may not meet the threshold for a full SWMS, or to complement it

☛ In simple terms:

A JSA is a practical, field-level risk assessment for how a specific ecological task will be carried out safely on that day.

[Click here for a list of approved Job Safety Analysis documents](#)

Select the JSA's that are applicable to your activity/task

- ☐ Pre-Clearing Assessments
- ☐ Remote and Isolated Work
- ☐ Clearing Supervision
- ☐ General Field Surveys
- ☐ N/A

What is a SOP?

A **Standard Operating Procedure (SOP)** is a documented set of **standardised instructions that describe how to carry out specific ecological tasks consistently and correctly**, regardless of site.

In ecological survey work, SOPs define **best-practice methods** for:

- Survey techniques
- Data collection
- Fauna handling
- Reporting and compliance activities

 In simple terms:

An SOP explains how to do the job properly; a SWMS/JSA explains how to do it safely in a specific environment.

[Click here for a list of approved Standard Operating Procedures](#)

Select the SOP's that are applicable to your activity/task

- ☐ Clearing Supervision
- ☐ Ecological Dewatering Activities
- ☐ Fieldwork Biosecurity
- ☐ Terrestrial Fauna Surveys
- ☐ Project Journey Management
- ☐ N/A

Risk Assessment – Site-Specific Hazards

Please identify and document all site-specific hazards, associated risks, and control measures relevant to this project.

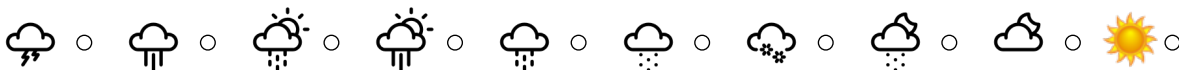

Note: You do not need to include hazards already listed in the Ecology Consulting Hazard Register. This section is intended to capture additional risks unique to the site or project activities that require specific attention and mitigation.
